The tension developed at the end of the cord is  $T = 150$  lb and  $\theta = 60^\circ$ . Thus

- 7-116.** A 100-lb cable is attached between two points at a distance 50 ft apart having equal elevations. If the maximum tension developed in the cable is 75 lb, determine the length of the cable and the sag.

From Example 7-15,

$$T_{max} = \frac{F_H}{\cos \theta_{max}} = 75 \text{ lb}$$

$$\cos \theta_{max} = \frac{F_H}{75}$$

For  $\frac{1}{2}$  of cable,

$$w_0 = \frac{\frac{100}{2}}{s} = \frac{50}{s}$$

$$\tan \theta_{max} = \frac{w_0 s}{F_H} = \frac{\sqrt{(75)^2 - F_H^2}}{F_H} = \frac{50}{F_H}$$

Thus,

$$\sqrt{(75)^2 - F_H^2} = 50; \quad F_H = 55.9 \text{ lb}$$

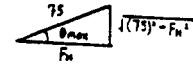

$$s = \frac{F_H}{w_0} \sinh \left( \frac{w_0}{F_H} x \right) = \frac{55.9}{\left( \frac{50}{s} \right)} \sinh \left[ \left( \frac{50}{s (55.9)} \right) \left( \frac{s}{2} \right) \right]$$

$$s = 27.8 \text{ ft}$$

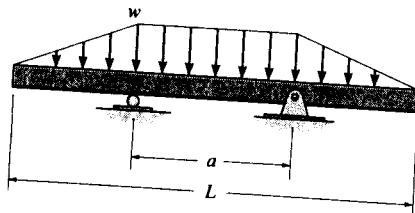

$$w_0 = \frac{50}{27.8} = 1.80 \text{ lb/ft}$$

$$\text{Total length} = 2s = 55.6 \text{ ft} \quad \text{Ans}$$

$$h = \frac{F_H}{w_0} \left[ \cosh \left( \frac{w_0 L}{2 F_H} \right) - 1 \right] = \frac{55.9}{1.80} \left[ \cosh \left( \frac{1.80 (50)}{2 (55.9)} \right) - 1 \right] \\ = 10.6 \text{ ft} \quad \text{Ans}$$

- 7-122. A chain is suspended between points at the same elevation and spaced a distance of 60 ft apart. If it has a weight of 0.5 lb/ft and the sag is 3 ft, determine the maximum tension in the chain.

$$x = \int \frac{ds}{\sqrt{\left(1 + \frac{1}{F_H} (w_0 ds)^2\right)}}$$

Performing the integration yields :

$$x = \frac{F_H}{0.5} \left[ \sinh^{-1} \left( \frac{1}{F_H} (0.5s + C_1) \right) + C_2 \right] \quad [1]$$

From Eq. 7-13

$$\frac{dy}{dx} = \frac{1}{F_H} \int w_0 ds$$

$$\frac{dy}{dx} = \frac{1}{F_H} (0.5s + C_1)$$

$$\text{At } s = 0; \quad \frac{dy}{dx} = 0 \quad \text{hence } C_1 = 0$$

$$\frac{dy}{dx} = \tan \theta = \frac{0.5s}{F_H} \quad [2]$$

Applying boundary conditions at  $x = 0; s = 0$  to Eq.[1] and using the result  $C_1 = 0$  yields  $C_2 = 0$ . Hence

$$s = \frac{F_H}{0.5} \sinh \left( \frac{0.5x}{F_H} \right) \quad [3]$$

Substituting Eq.[3] into [2] yields :

$$\frac{dy}{dx} = \sinh \left( \frac{0.5x}{F_H} \right) \quad [4]$$

Performing the integration

$$y = \frac{F_H}{0.5} \cosh \left( \frac{0.5x}{F_H} \right) + C_3$$

Applying boundary conditions at  $x = 0; y = 0$  yields  $C_3 = -\frac{F_H}{0.5}$ . Therefore

$$y = \frac{F_H}{0.5} \left[ \cosh \left( \frac{0.5x}{F_H} \right) - 1 \right]$$

$$\text{At } x = 30 \text{ ft}; \quad y = 3 \text{ ft} \quad 3 = \frac{F_H}{0.5} \left[ \cosh \left( \frac{0.5}{F_H} (30) \right) - 1 \right]$$

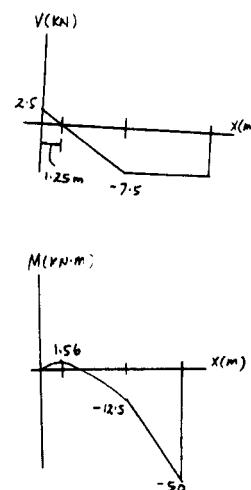

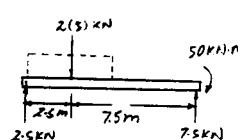

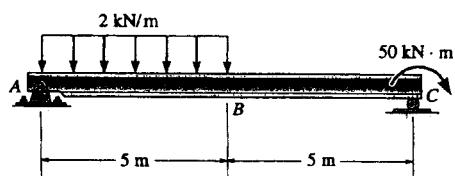

By trial and error  $F_H = 75.25 \text{ lb}$

At  $x = 30 \text{ ft}; \quad \theta = \theta_{max}$ . From Eq.[4]

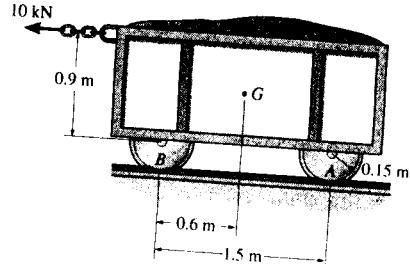

$$\tan \theta_{max} = \left. \frac{dy}{dx} \right|_{x=30 \text{ ft}} = \sinh \left( \frac{0.5(30)}{75.25} \right) \quad \theta_{max} = 11.346^\circ$$

$$T_{max} = \frac{F_H}{\cos \theta_{max}} = \frac{75.25}{\cos 11.346^\circ} = 76.7 \text{ lb.} \quad \text{Ans}$$

- 7-123. Draw the shear and moment diagrams for the beam.

- 8-1. The mine car and its contents have a total mass of 6 Mg and a center of gravity at  $G$ . If the coefficient of static friction between the wheels and the tracks is  $\mu_s = 0.4$  when the wheels are locked, find the normal force acting on the front wheels at  $B$  and the rear wheels at  $A$  when (a) only the brakes at  $A$  are locked, and (b) the brakes at both  $A$  and  $B$  are locked. In either case, does the car move?

**Equations of Equilibrium:** The normal reactions acting on the wheels at ( $A$  and  $B$ ) are independent as to whether the wheels are locked or not. Hence, The normal reactions acting on the wheels are the same for both cases.

$$+ \sum M_B = 0; \quad N_A (1.5) + 10(1.05) - 58.86(0.6) = 0 \\ N_A = 16.544 \text{ kN} = 16.5 \text{ kN}$$

Ans

$$+ \uparrow \sum F_y = 0; \quad N_B + 16.544 - 58.86 = 0 \\ N_B = 42.316 \text{ kN} = 42.3 \text{ kN}$$

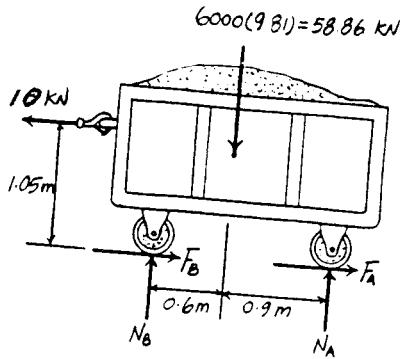

Ans

**Friction:** When the wheels at  $A$  are locked,  $(F_A)_{\max} = \mu_s N_A = 0.4(16.544) = 6.6176 \text{ kN}$ . Since  $(F_A)_{\max} < 10 \text{ kN}$ , the wheels at  $A$  will slip and the wheels at  $B$  will roll. Thus, the mine car moves.

Ans

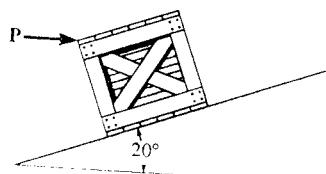

When both wheels at  $A$  and  $B$  are locked, then  $(F_A)_{\max} = \mu_s N_A = 0.4(16.544) = 6.6176 \text{ kN}$  and  $(F_B)_{\max} = \mu_s N_B = 0.4(42.316) = 16.9264 \text{ kN}$ . Since  $(F_A)_{\max} + (F_B)_{\max} = 23.544 \text{ kN} > 10 \text{ kN}$ , the wheels do not slip. Thus, the mine car does not move.

Ans

$$+ \uparrow \sum F_y = 0; \quad N_c - 300 \cos 20^\circ - 80 \sin 20^\circ = 0 \\ N_c = 309.26 \text{ lb}$$

$$(F_c)_{\max} = \mu_s N_c; \quad (F_c)_{\max} = 0.3(309.26) = 92.8 \text{ lb} > 27.43 \text{ lb} \quad (\text{O.K!})$$

$$F_c = 27.4 \text{ lb}$$

$$N_c = 309 \text{ lb}$$
